Web API

The Rastrac Web API allows broad control of Rastrac's suite of vehicle tracking features from most programming environments. This allows anything from automated scripting of common tasks to seamless integration into customer user interfaces alongside other business-specific tools.

What are the benefits of Rastrac's Web API?

Most Rastrac features can be fully manipulated via the API. These features include:

- **Acquiring the latest positions or instrument measurements of tracked devices.**

- **Registration or modifcation of devices within the system.**

- **Issuing custom device messages.**

- **Checking customized notifications sent by devices.**

All features seen functioning in Rastrac's HTML5 tracking website are built on top of this Web API, allowing for the broadest possible spectrum of integration capabilities.
